The mean and the variance of a normal distribution:
First we find the moment generating function.

$$M_X(t) = \int_{-\infty}^{\infty} e^{tx} \cdot \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2} \, dx$$

$$= \frac{1}{\sigma\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\frac{1}{2\sigma^2}\left(-2xt\sigma^2+(x-\mu)^2\right)} \, dx$$

In the exponent we have:

$$-2xt\sigma^2 + (x-\mu)^2 = -2xt\sigma^2 + x^2 - 2x\mu + \mu^2 = x^2 - 2x(\mu + t\sigma^2) + \mu^2.$$

Completing the square gives:

$$x^2 - 2x(\mu + t\sigma^2) + \mu^2 = (x - (\mu + t\sigma^2))^2 - 2\mu t\sigma^2 - t^2\sigma^4.$$

This allows us to write

$$M_X(t) = e^{\mu t + \frac{1}{2}t^2\sigma^2} \left(\frac{1}{\sigma\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\frac{1}{2}\left(\frac{x-(\mu+t\sigma)}{\sigma}\right)^2} \, dx \right) = e^{\mu t + \frac{1}{2}t^2\sigma^2}$$

The moment generating function for normally distributed random variable X is:

$$M_X(t) = e^{\mu t + \frac{1}{2}t^2\sigma^2}$$

Now we will show that the mean and variance of X are indeed μ and σ^2.

First derivative of the moment generating function:

$$\frac{d}{dt}M_X(t) = \frac{d}{dt}e^{\mu t + \frac{1}{2}t^2\sigma^2} = e^{\mu t + \frac{1}{2}t^2\sigma^2} \cdot (\mu + \sigma^2 t)$$

Second derivative of the moment generating function:

$$\frac{d^2}{dt^2}M_X(t) = \frac{d}{dt}\left(\mu e^{\mu t + \frac{1}{2}t^2\sigma^2} + \sigma^2 t e^{\mu t + \frac{1}{2}t^2\sigma^2}\right)$$

$$= \mu e^{\mu t + \frac{1}{2}t^2\sigma^2} \cdot (\mu + \sigma^2 t) + \sigma^2 e^{\mu t + \frac{1}{2}t^2\sigma^2}$$

$$+ \sigma^2 t e^{\mu t + \frac{1}{2}t^2\sigma^2} \cdot (\mu + \sigma^2 t)$$

Setting $t = 0$ in both gives:

$$\frac{d}{dt}M_X(t) = \mu \qquad \frac{d^2}{dt^2}M_X(t) = \mu^2 + \sigma^2$$

Therefore **the mean, $E(X)$, is μ; and the variance is** $E(X^2) - \mu^2 = \sigma^2$.

The Standard Normal Distribution

The normal distribution with $\mu = 0$ and $\sigma = 1$ is called the *standard normal distribution*.

$$n(x; 0, 1) = \frac{1}{\sqrt{2\pi}} e^{-\frac{1}{2}x^2}$$

Probabilities for the standard normal distribution may be found by way of a table of “pre-calculated” probabilities.

For example, Table III in the text book gives $P(0 \leq X \leq z)$ for various z values. Graphically this looks like,

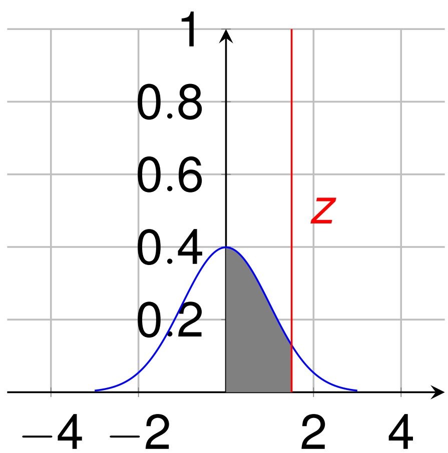

Table III: Standard Normal Distribution

z	.00	.01	.02	.03	.04	.05	.06	.07	.08	.09

$$P(0 \leq X \leq 1.52)$$
$$= 0.4357$$

Standard Normal Table

We noted earlier that μ, in this case 0, is the midpoint of the graph. Thus to find $P(X \leq z)$, we look up our value of z in the table, then add 0.5.

Table III: Standard Normal Distribution

z	.00	.01	.02	.03	.04	.05	.06	.07	.08	.09
0.0	.0000	.0040	.0080	.0120	.0160	.0199	.0239	.0279	.0319	.0359

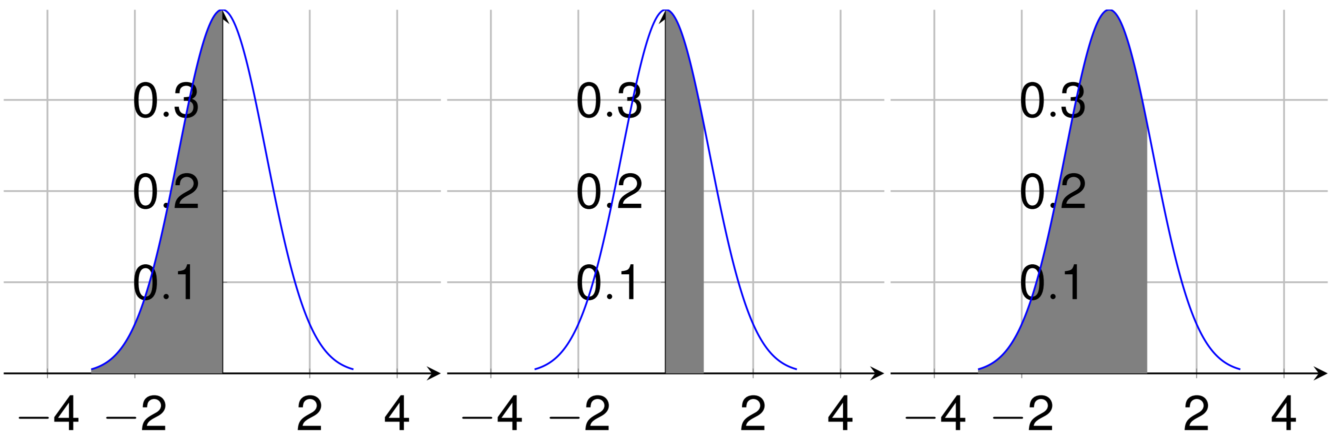
$$P(X \leq 0.87)$$
$$= 0.3087 + 0.5$$
$$= 0.8087$$



Adding the first two areas gives the third.

Standard Normal Table

If $z < 0$, we find $P(X \leq z)$ by finding $0.5 - P(X \leq |z|)$.

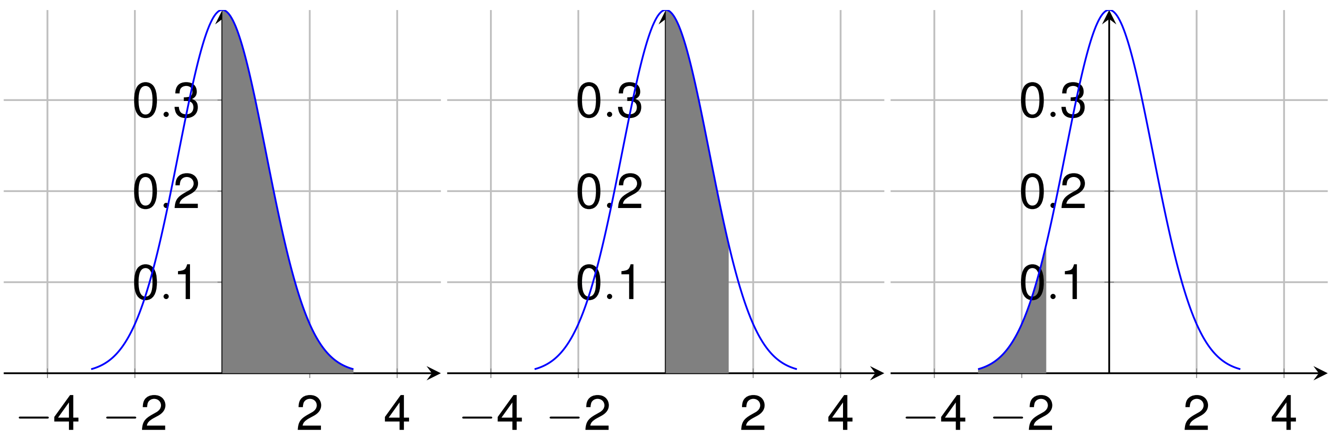
$$P(X \leq -1.44)$$
$$= 0.5 - 0.4251$$
$$= 0.0749$$



The difference of the first two areas is equal to the third.

Standard Normal Table

If X has standard normal distribution, find $P(-0.75 \leq X \leq 1.22)$

2.9	.4981	.4982	.4982	.4983	.4984	.4984	.4985	.4985	.4986	.4988
3.0	.4987	.4987	.4987	.4988	.4988	.4989	.4989	.4989	.4990	.4990

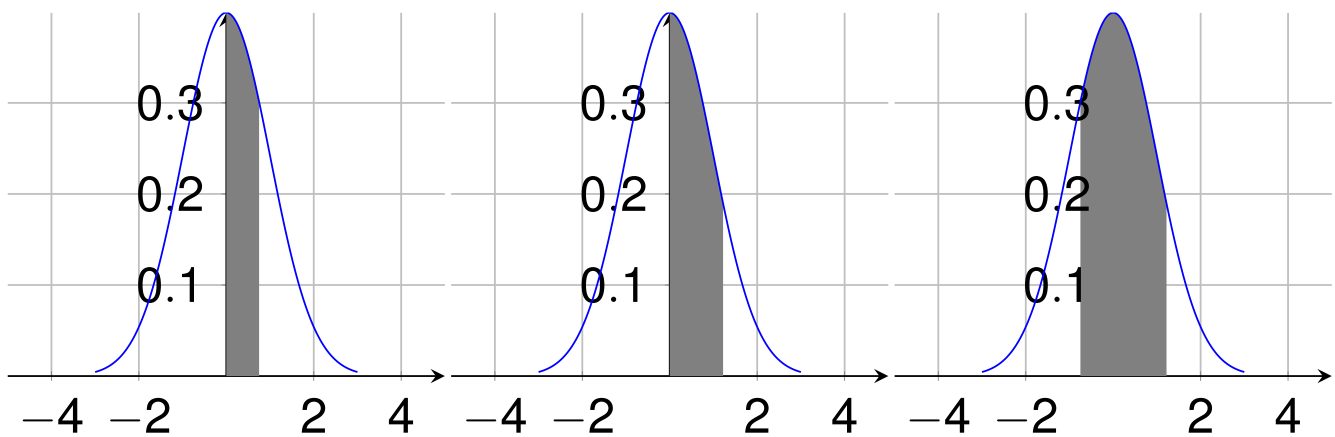
$$P(-0.75 \leq X \leq 1.22) = 0.2374 + 0.3888 = 0.6262$$



$$P(0 \leq X \leq 0.75) + P(0 \leq X \leq 1.22) = P(-0.75 \leq X \leq 1.22)$$

The sum of the first two areas equals the third. (This plays on the symmetry of the graph)

Standard Normal Table

A couple of rules when using the table:

- For z values not found on the table we may simply choose the closest value.
- If our z value is exactly the midpoint between two z values on the table, then we can average the two probabilities.

The Normal Distribution

Theorem

If X has a normal distribution with mean μ and standard deviation σ then

$$Z = \frac{X - \mu}{\sigma}$$

is a random variable having the standard normal distribution.

This allows us to compute probabilities for non-standard normal distributions with the standard normal table.

Proof

Let $Z = \frac{X-\mu}{\sigma}$. First note that

$$x_1 < X < x_2 \quad \Leftrightarrow \quad z_1 = \frac{x_1 - \mu}{\sigma} < Z < \frac{x_2 - \mu}{\sigma} = z_2$$

Then, using the substitution rule for integrals,

$$\begin{aligned} P(x_1 < X < x_2) &= \frac{1}{\sigma\sqrt{2\pi}} \int_{x_1}^{x_2} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2} \, dx \\ &= \frac{1}{\sigma\sqrt{2\pi}} \int_{z_1}^{z_2} e^{-\frac{1}{2}(z)^2} \, dz \\ &= P(z_1 < Z < z_2). \end{aligned}$$

Therefore $P(x_1 < X < x_2) = P\left(\frac{x_1-\mu}{\sigma} < Z < \frac{x_2-\mu}{\sigma}\right)$, and we are able to look this up on the table.
