The mean and the variance of a normal distribution:

First we find the moment generating function.

$$M_X(t) = \int_{-\infty}^{\infty} e^{tx} \cdot \frac{1}{\sigma\sqrt{2\pi}} e^{-\frac{1}{2}\left(\frac{x-\mu}{\sigma}\right)^2} dx$$
$$= \frac{1}{\sigma\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\frac{1}{2\sigma^2}\left(-2xt\sigma^2 + (x-\mu)^2\right)} dx$$

In the exponent we have:

$$-2xt\sigma^{2} + (x-\mu)^{2} = -2xt\sigma^{2} + x^{2} - 2x\mu + \mu^{2} = x^{2} - 2x(\mu + t\sigma^{2}) + \mu^{2}.$$

Completing the square gives:

$$x^{2} - 2x(\mu + t\sigma^{2}) + \mu^{2} = (x - (\mu + t\sigma^{2}))^{2} - 2\mu t\sigma^{2} - t^{2}\sigma^{4}.$$

This allows us to write

$$M_X(t) = e^{\mu t + \frac{1}{2}t^2\sigma^2} \left(\frac{1}{\sigma\sqrt{2\pi}} \int_{-\infty}^{\infty} e^{-\frac{1}{2}\left(\frac{x - (\mu + t\sigma)}{\sigma}\right)^2} dx \right) = e^{\mu t + \frac{1}{2}t^2\sigma^2}$$

The moment generating function for normally distributed random variable X is:

$$M_X(t) = e^{\mu t + \frac{1}{2}t^2\sigma^2}$$

Now we will show that the mean and variance of X are indeed μ and σ^2 .

First derivative of the moment generating function:

$$\frac{d}{dt}M_X(t) = \frac{d}{dt}e^{\mu t + \frac{1}{2}t^2\sigma^2} = e^{\mu t + \frac{1}{2}t^2\sigma^2} \cdot (\mu + \sigma^2 t)$$

Second derivative of the moment generating function:

$$\frac{d^2}{dt^2} M_X(t) = \frac{d}{dt} \left(\mu e^{\mu t + \frac{1}{2}t^2 \sigma^2} + \sigma^2 t e^{\mu t + \frac{1}{2}t^2 \sigma^2} \right)$$

$$= \mu e^{\mu t + \frac{1}{2}t^2 \sigma^2} \cdot (\mu + \sigma^2 t) + \sigma^2 e^{\mu t + \frac{1}{2}t^2 \sigma^2}$$

$$+ \sigma^2 t e^{\mu t + \frac{1}{2}t^2 \sigma^2} \cdot (\mu + \sigma^2 t)$$

Setting t = 0 in both gives:

$$\frac{d}{dt}M_X(t) = \mu \qquad \frac{d^2}{dt^2}M_X(t) = \mu^2 + \sigma^2$$

Therefore the mean, E(X), is μ ; and the variance is $E(X^2) - \mu^2 = \sigma^2$.

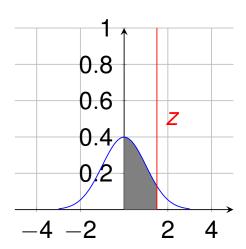

The Standard Normal Distribution

The normal distribution with $\mu = 0$ and $\sigma = 1$ is called the standard normal distribution.

$$n(x;0,1) = \frac{1}{\sqrt{2\pi}}e^{-\frac{1}{2}x^2}$$

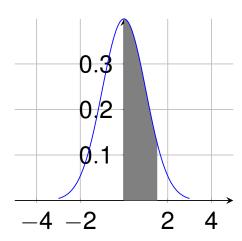

Probabilities for the standard normal distribution may be found by way of a table of "pre-calculated" probabilities.

For example, Table III in the text book gives $P(0 \le X \le z)$ for various z values. Graphically this looks like,

| Tabl | Table III: Standard Normal Distribution | | | | | | | | | | | |
|------|-----------------------------------------|-------|-------|-------|-------|-------|-------|-------|-------|-------|--|--|

$$P(0 \le X \le 1.52)$$

= 0.4357

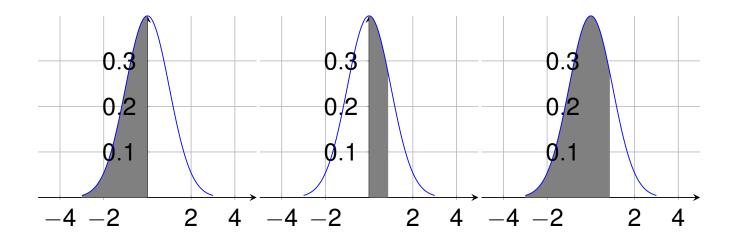

We noted earlier that μ , in this case 0, is the midpoint of the graph. Thus to find $P(X \le z)$, we look up our value of z in the table, then add 0.5.

$$P(X \le 0.87)$$

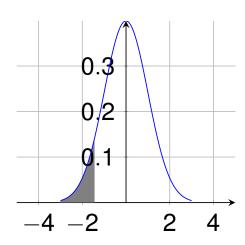

= 0.3087 + 0.5
= 0.8087

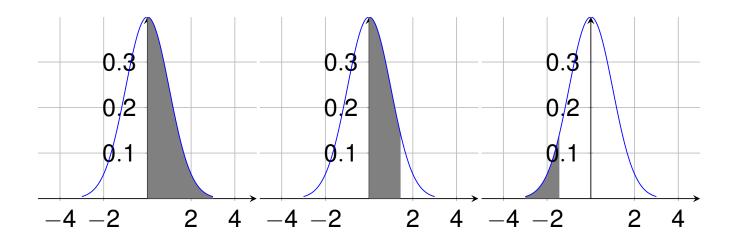

Adding the first two areas gives the third.

If z < 0, we find $P(X \le z)$ by finding $0.5 - P(X \le |z|)$.

$$P(X \le -1.44) = 0.5 - 0.4251 = 0.0749$$

The difference of the first two areas is equal to the third.

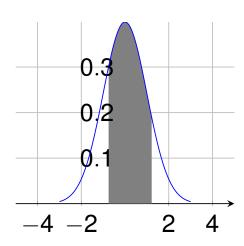

If X has standard normal distribution, find $P(-0.75 \le X \le 1.22)$

| | | | | | | | | | | | | |

$$P(-0.75 \le X \le 1.22)$$

= 0.2374 + 0.3888
= 0.6262

$$P(0 \le X \le 0.75) + P(0 \le X \le 1.22) = P(-0.75 \le X \le 1.22)$$

The sum of the first two areas equals the third. (This plays on the symmetry of the graph)

A couple of rules when using the table:

- ► For z values not found on the table we may simply choose the closest value.
- If our z value is exactly the midpoint between two z values on the table, then we can average the two probabilities.

The Normal Distribution

Theorem

If X has a normal distribution with mean μ and standard deviation σ then

$$Z = \frac{X - \mu}{\sigma}$$

is a random variable having the standard normal distribution.

This allows us to compute probabilities for non-standard normal distributions with the standard normal table.

Proof

Let $Z = \frac{X - \mu}{\sigma}$. First note that

$$x_1 < X < x_2 \quad \Leftrightarrow \quad z_1 = \frac{x_1 - \mu}{\sigma} < Z < \frac{x_2 - \mu}{\sigma} = z_2$$

Then, using the substitution rule for integrals,

$$P(x_1 < X < x_2) = \frac{1}{\sigma\sqrt{2\pi}} \int_{x_1}^{x_2} e^{-\frac{1}{2}(\frac{x-\mu}{\sigma})^2} dx$$

$$= \frac{1}{\sigma\sqrt{2\pi}} \int_{z_1}^{z_2} e^{-\frac{1}{2}(z)^2} dz$$

$$= P(z_1 < Z < z_2).$$

Therefore $P(x_1 < X < x_2) = P\left(\frac{x_1 - \mu}{\sigma} < Z < \frac{x_2 - \mu}{\sigma}\right)$, and we are able to look this up on the table.

Non-standard Normal Distribution

Example

Let X be a continuous random variable with normal distribution n(x,70,4); i.e. $\mu=70,\sigma=4$. Find

1.
$$P(68 \le X \le 74)$$

Non-standard Normal Distribution

By the theorem

$$P(68 \le X \le 74) = P(\frac{68 - 70}{4} \le Z \le \frac{74 - 70}{4}) = P(-0.5 \le Z \le 1)$$

Then, by the symmetry in the graph,

$$P(-0.5 \le Z \le 1) = P(Z \le 0.5) + P(Z \le 1)$$

= 0.1915 + 0.3413 = 0.5328

The Normal Approximation of the Binomial Distribution

If X is a random variable with binomial distribution $b(x; n, \theta)$, then the normal distribution $n(x; n\theta, \sqrt{n\theta(1-\theta)})$, with mean $n\theta$ and standard deviation $\sqrt{n\theta(1-\theta)}$, gives an approximation of the binomial distribution.

See the text book for how this is derived using the moment generating functions as $n \to \infty$.

To use this approximation, we need to "convert" the discrete binomial random variable to the continuous case. Here P(X = k) will be a approximated with the normal distribution by integrating from k - 0.5 to k + 0.5.

The Normal Approximation of the Binomial Distribution

Example

Find the probability of getting 6 heads in 16 flips of a balanced coin. (binomial distribution)

Approximate this with the normal distribution.
