## Example 3.4.6 Find the cumulative distribution function F(x) for

$$f(x) = \begin{cases} 3e^{-3x} & \text{for } x > 0 \\ 0 & \text{elsewhere} \end{cases}$$
and use it to evaluate  $P(0.5 \le X \le 1)$ .

For  $x > 0$  we have
$$f(x) = \int_{-\infty}^{\infty} f(t) dt = \int_{0}^{x} 3e^{-3t} dt = -e^{-3t} \Big|_{0}^{x} = -e^{-3x} + 1.$$

$$-e^{-3x} - (-e^{-3x}) = -e^{-3x} + 1.$$

For  $x \le 0$ , f(x) = 0. Therefore f(x) = 0.

$$F(x) = \begin{cases} 0 & \text{for } x \le 0\\ 1 - e^{-3x} & \text{for } x > 0 \end{cases}$$

e = 2.71 ...

Then using the theorem,

$$P(0.5 \le X \le 1) = ... + (1) - + (0.5)$$

$$= (1 - e^{-3 \cdot 1}) - (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3}) + (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3}) + (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3}) + (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3 \cdot 1}) - (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3 \cdot 1}) - (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3 \cdot 1}) - (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3 \cdot 1}) - (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3 \cdot 1}) - (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3 \cdot 1}) - (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3 \cdot 1}) - (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3 \cdot 1}) - (1 - e^{-3 \cdot 0.5})$$

$$= (1 - e^{-3 \cdot 1}) - (1 - e^{-3 \cdot 0.5})$$

## 3.5 Multivariate Distributions

We now consider the case when two or more random variables are defined on the same (joint) sample space. We start with the **bivariate** case, that is when two random variables X and Y are defined for a common sample space.

For example X could be the sum of rolling two dice, and Y could be the product.

Write P(X = x, Y = y) for the probability of the intersection of events X = x and Y = y.

Example 3.5.1 Two caplets are randomly selected from a bottle containing 3 aspirin, 2 sedative, and 4 laxative.

Let X be the number of aspirin selected, and Y be the number of sedative selected. 3+2+1=9 caplets totals

Find the probabilities associated to each possible pair of values for X and Y.

X: # aspirin selected 2 sedatives Y: # sedatives selected 4 laxartives

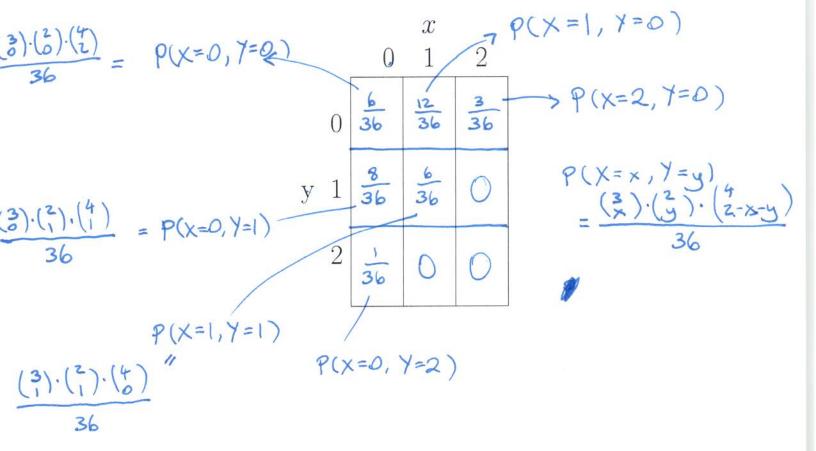

The possible pairs for X, Y are: (0,0), (1,0), (0,1), (2,0), (1,1), (0,2).

There are  $\binom{9}{2} = 36$  different possible two-pill selections that can be drawn.

The number of different ways to draw x aspirin, y sedative, and therefore 2 - x - y laxative (where  $0 \le x + y \le 2$ ) is

Thus  $\begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
2 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $\begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
2 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
2 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
2 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
2 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
2 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
2 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
2 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
3 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
2 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
3 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
2 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
3 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
2 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
3 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
3 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
3 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
3 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
3 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ y
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ 2 - x - y
\end{pmatrix}.$ Thus  $P(X = x, Y = y) = \begin{pmatrix}
4 \\ x
\end{pmatrix} \cdot \begin{pmatrix}
4 \\ y
\end{pmatrix} \cdot \begin{pmatrix}$ 

We summarize the probabilities in a table:

If X and Y are discrete random variables, then the function

$$f(x,y) = P(X = x, Y = \mathbf{y})$$

for each pair (x, y) in the range of X and Y is called the **joint probability distribution of** X and Y.

**Theorem 3.5.2** A bivariate function f can serve as a joint probability distribution for discrete random variables X and Y if and only if

1. 
$$f(x,y) \ge 0$$
.

 $\underbrace{\sum_{x} \sum_{y} f(x,y) = 1, \text{ where the double sum is taken over all possible pairs } (x,y) = 1, \text{ where the double sum is taken over all possible pairs } (x,y).$ 

To verify the theorem for the caplet example, note that all values are non-negative and

$$\sum_{x} \sum_{y} f(x,y) = \underbrace{f(0,0)}_{x} + \underbrace{f(1,0)}_{x} + \underbrace{f(2,0)}_{x} + f(0,1) + f(1,1) + f(0,2)$$
$$= \frac{6}{36} + \frac{12}{36} + \frac{3}{36} + \frac{8}{36} + \frac{6}{36} + \frac{1}{36} = 1.$$

discrete random variables

**Example 3.5.3** Suppose the joint probability distribution of X and Y is given by

$$f(x,y) = c(x^2 + y^2)$$

for all pairs (x, y) with x = -1, 0, 1, 3 and y = -1, 2, 3. Find the value of c.

all possible pairs: (-1,-1), (-1,2), (-1,3) (0,-1), (0,2), (0,3) (1,-1), (1,2), (1,3)(3,-1), (3,2), (3,3)

Since f(x,y) is a joint probability distribution, by Theorem 35.2 (part 2), we must have f(-1,-1) + f(-1,2) + f(-1,3) + f(0,-1) + f(0,2) + f(0,3) + f(1,-1) + f(1,2) + f(1,3) + f(3,-1) + f(3,2) + f(3,3) = 1

50,  $c((-1)^2+(-1)^2)+c((-1)^2+2^2)+...=1$ .

Therefore, c(2+5+10+1+4+9+2+5+10+10+13+18)=1=>  $89c=1=>c=\frac{1}{89}$ .

Observe that  $f(x,y) = c(x^2+y^2)$  is non-negative for all (x,y).

If X and Y are discrete random variables, with joint probability distribution f, then the function

$$F(x,y) = P(X \le x, Y \le y) = \sum_{s \le x} \sum_{t \le y} f(s,t)$$

defined for all  $x, y \in \mathbb{R}$ , is called the **joint cumulative distribution** of X and Y, or the **joint distribution function**.

**Example 3.5.4** Let F(x,y) be the joint cumulative distribution of the caplet example. Find F(2,1.3).

To find  $F(2, 1.3) = P(X \le 2, Y \le 1.3)$  we must sum the probabilities f(x, y) over all pairs (x, y) in the range of X and Y with  $x \le 2$  and  $y \le 1.3$ .

$$\begin{array}{lll}
\leq 1.3. & \times = 0, \ y = 0 & P(X = 0, Y = 0) = \frac{6}{36} \\
\times = 1, \ y = 0 & P(X = 1, Y = 0) = \frac{12}{36} \\
\times = 2, \ y = 0 & P(X = 2, Y = 0) = \frac{3}{36} \\
\times = 0, \ 86 \ y = 1 & P(X = 0, Y = 1) = \frac{8}{36} \\
\times = 0, \ y = 1 & P(X = 0, Y = 1) = \frac{8}{36} \\
\times = 1, \ y = 1 & P(X = 1, Y = 1) = \frac{6}{36} \\
\times = 1, \ y = 1 & P(X = 1, Y = 1) = \frac{6}{36}
\end{array}$$

The pairs included here are ...

Therefore

$$F(2,1.3) = f(0,0) + .f(1,0) + f(2,0) + f(0,1) + f(1,1) * =  $\frac{6}{36} + \frac{12}{36} + \frac{3}{36} + \frac{8}{36} + \frac{6}{36} = \frac{35}{36}$$$

As with the single variable case we have the following properties.

**Theorem 3.5.5** If F(x,y) is the joint cumulative distribution for discrete random variables X and Y then

1. 
$$\lim_{x,y\to-\infty} F(x,y) = 0$$
,

2. 
$$\lim_{x,y\to\infty} F(x,y) = 1$$
, and
